1 Notations

- The symbol const for const.
- The symbol \curvearrowleft for function returned value.
- Template class parameters lead by outlined character. For example: T, Key, Compare. Interpreted in template definition context.
- Sometimes class, typename dropped.
- Template class parameters dropped, thus C sometimes used instead of $C(\mathbb{T})$.
- "See example" by \$\infty\$, its output by \$\infty\$.

2 Containers

2.1 Pair

#include <utility>

```
template (class T1, class T2)
struct pair {
    T1 first; T2 second;
    pair() {}
    pair(const T1& a, const T2& b):
        first(a), second(b) {} };
```

2.1.1 Types

pair::first_type pair::second_type

2.1.2 Functions & Operators

See also 2.2.3. $\operatorname{pair}\langle \mathbb{T}1, \mathbb{T}2 \rangle$ $\operatorname{\mathbf{make_pair}}\langle \mathbb{C}1, \mathbb{T}2 \rangle$ $\operatorname{\mathbf{T}}1\&, \mathbb{C}1\&, \mathbb{C}2\&);$

2.2 Containers — Common

Here X is any of {vector, deque, list, set, multiset, map, multimap}

2.2.1 Types

X::value_type
X::reference
X::const_reference
X::iterator
X::const_iterator
X::reverse_iterator
X::const_reverse_iterator
X::difference_type
X::size_type
Iterators reference value_type (See 6).

2.2.2 Members & Operators

```
X::X();
X::X(\stackrel{const}{=} X\&);
X::~X():
X\& X::operator=(\underbrace{const}\ X\&);
X::iterator
                                  X::\mathbf{begin}();
                                  X::begin()
X::const_iterator
                                                      const .
X::iterator
                                  X::\mathbf{end}():
                                  X::\mathbf{end}()
X::const_iterator
                                                      const:
X::reverse_iterator
                                  X::rbegin();
X::const_reverse_iterator X::rbegin()
                                                     const :
                                  X::\mathbf{rend}():
X::reverse_iterator
X::const_reverse_iterator X::rend()
                                                      const :
X::size\_type \quad X::size() \stackrel{const}{=};
X::size\_type \quad X::max\_size() \stackrel{const}{=};
bool
                  X::\mathbf{empty}() \cong ;
```

2.2.3 Comparison Operators

X::swap(X& x);

```
Let, X v, w. X may also be pair (2.1).

v == w v != w

v < w v > w

v := w
```

All done lexicographically and ✓bool.

2.3 Sequence Containers

S is any of {vector, deque, list}

2.3.1 Constructors

void

void X::clear():

```
\begin{array}{lll} \text{S::S(S::size\_type} & n, \\ & \underbrace{\text{const}} \text{ S::value\_type\&} & t); \\ \text{S::S(S::const\_iterator} & \textit{first}, \\ & \text{S::const\_iterator} & \textit{last}); \\ \end{array}
```

2.3.2 Members

```
S::iterator // inserted copy
S::insert(S::iterator
                                 before.
           const S::value_tvpe&
                                val);
S::iterator // inserted copy
S::insert(S::iterator
                                 before,
           S::size_tvpe
                                nVal.
           const S::value_tvpe&
S::iterator // inserted copy
S::insert(S::iterator
                             before.
           S::const_iterator first.
           S::const_iterator last);
```

S:iterator S::erase(S::iterator position);

```
S::terator S::erase(S::const_iterator first, post erased S::const_iterator last);

void S::push_back(const S::value_type& x);

void S::pop_back();

S::reference S::front();

S::const_reference S::front() const ;

S::reference S::back();

S::const_reference S::back() const ;
```

2.4 Vector

#include <vector>

```
 \begin{array}{c} \operatorname{template}\langle \operatorname{class} \ \mathbb{T}, \\ \operatorname{class} \ \mathbb{A} \operatorname{lloc} = \operatorname{allocator} \rangle \\ \operatorname{class} \ \mathbf{vector}; \end{array}
```

```
See also 2.2 and 2.3. size_type vector::capacity() const; void vector::reserve(size_type n); vector::reference vector::operator[](size_type i); vector::const_reference vector::operator[](size_type i) const;
```

2.5 Deque

#include <deque>

```
\begin{array}{c} \operatorname{template}\langle \operatorname{class} \ \mathbb{T}, \\ \operatorname{class} \ \mathbb{A} \operatorname{lloc} = \operatorname{allocator}\rangle \\ \operatorname{class} \ \mathbf{deque}; \end{array}
```

Has all of **vector** functionality (see 2.4). void deque::**push_front**($\underline{\text{const}} \ \mathbb{T} \& \ x$); void deque::**pop_front**();

2.6 List

#include <list>

```
\begin{array}{c} \text{template}\langle \text{class } \mathbb{T}, \\ \text{class } \mathbb{A} \, \text{lloc} = \text{allocator} \rangle \\ \text{class } \, \textbf{list}; \end{array}
```

```
See also 2.2 and 2.3.

void list::pop_front();

void list::push_front(\underline{const} \ \mathbb{T}\&\ x);

void // move all x\ (\&x \neq this) before pos

list::splice(iterator pos, list(\mathbb{T})& x); \mathbb{R}^37.2

void // move x's xElemPos before pos

list::splice (iterator pos,

list(\mathbb{T})& x.
```

iterator *xElemPos*): \$\sigma_7.2\$

```
void // move x's [xFirst,xLast) before pos
list::splice (iterator pos,
                \operatorname{list}\langle \mathbb{T}\rangle \& x.
                iterator
                             xFirst.
                            xLast);
                                           FF 7.2
                iterator
void list::remove(\underline{\text{const}} \mathbb{T}& value);
void list::remove_if(Predicate pred);
// after call: \forall this iterator p, *p \neq *(p+1)
void list::unique(); // remove repeats
void // as before but, \neg binPred(*p, *(p+1))
list::unique(\mathbb{B} inaryPredicate binPred);
// Assuming both this and x sorted
void list::merge(list\langle \mathbb{T} \rangle \& x);
// merge and assume sorted by cmp
void list::\mathbf{merge}(\operatorname{list}\langle \mathbb{T}\rangle \& x, \mathbb{C}\operatorname{ompare} cmp);
void list::reverse():
void list::sort();
void list::sort(\mathbb{C}ompare cmp);
```

2.7 Sorted Associative

```
Here A any of {set, multiset, map, multimap}.
```

2.7.1 Types

2.7.2 Constructors

```
A::A(\mathbb{C}ompare c = \mathbb{C}ompare())

A::A(A::const_iterator first,
A::const_iterator last,
\mathbb{C}ompare c = \mathbb{C}ompare());
```

2.7.3 Members

```
A::keycompare A::key_comp() const;
A::value_compare A::value_comp() const;
A::iterator A::insert(A::iterator hint,
const A::value_type& val);
void A::insert(A::iterator first,
A::iterator last);
A::size_type // # erased
A::erase(const A::key_type& k);
void A::erase(A::iterator p);
void A::erase(A::iterator first,
A::iterator last);
A::size_type
A::count(const A::key_type& k) const;
```

A::iterator A::find(\subseteq A::kev_type& k) \subseteq ;

A::iterator A::lower_bound($\underline{\text{const}}$ A::key_type& k) $\underline{\text{const}}$; A::iterator A::upper_bound($\underline{\text{const}}$ A::key_type& k) $\underline{\text{const}}$; pair \langle A::iterator, A::iterator \rangle // see 4.3.1 A::equal_range($\underline{\text{const}}$ A::key_type& k) $\underline{\text{const}}$;

2.8 Set

#include <set>

```
 \begin{array}{|c|c|c|c|c|} \hline template\langle class & \mathbb{K}ey, \\ class & \mathbb{C}ompare = less\langle \mathbb{K}ey\rangle, \\ class & \mathbb{A}lloc = allocator\rangle \\ class & \textbf{set}; \\ \hline \end{array}
```

See also 2.2 and 2.7.

set::set($\underline{\text{const}}$ Compare& cmp = Compare()); pair\set::iterator, bool\ // bool = if new set::insert($\underline{\text{const}}$ set::value_type& x);

2.9 Multiset

#include <multiset.h>

```
\begin{array}{c} \operatorname{template}\langle \operatorname{class} \ \mathbb{K} \texttt{ey}, \\ \operatorname{class} \ \mathbb{C} \texttt{ompare} = \operatorname{less}\langle \mathbb{K} \texttt{ey}\rangle, \\ \operatorname{class} \ \mathbb{A} \ \operatorname{lloc} = \operatorname{allocator}\rangle \\ \operatorname{class} \ \mathbf{multiset}; \end{array}
```

See also 2.2 and 2.7.

multiset::multiset(

 $\underline{\text{const}} \mathbb{C} \text{ompare} \& cmp = \mathbb{C} \text{ompare}());$

multiset::multiset(

InputIterator first,
InputIterator last,
const Compare& cmp=Compare());
multiset::iterator // inserted copy

 $multiset::\mathbf{insert}(\underline{\mathtt{const}}\ multiset::value_type\&\ x);$

2.10 Map

#include <map>

```
\begin{array}{c} \operatorname{template}\langle \operatorname{class} \ \mathbb{K} \mathbf{ey}, \operatorname{class} \ \mathbb{T}, \\ \operatorname{class} \ \mathbb{C} \mathbf{ompare} = \operatorname{less}\langle \mathbb{K} \mathbf{ey}\rangle, \\ \operatorname{class} \ \mathbb{A} \operatorname{lloc} = \operatorname{allocator}\rangle \\ \operatorname{class} \ \mathbf{map}; \end{array}
```

See also 2.2 and 2.7.

2.10.1 Types

map::value_type // pair $\langle const | Key, T \rangle$

2.10.2 Members

```
map::map(
```

T& map:operator[](seest map::key_type&);
map::const_iterator
map::lower_bound(

 $\underset{\text{const}}{\text{const}} \text{ map::key_type\& } k) \xrightarrow{\text{const}};$

map::const_iterator map::upper_bound(

air/map::const_iterator_map::const_

 $\begin{array}{l} pair \langle map::const_iterator, \ map::const_iterator \rangle \\ map::equal_range(\end{array}$

 $\underline{\text{const}}$ map::key_type& k) $\underline{\text{const}}$;

Example

```
typedef map<string, int> MSI;
MSI nam2num;
nam2num.insert(MSI::value_type("one", 1));
nam2num.insert(MSI::value_type("two", 2));
nam2num.insert(MSI::value_type("three", 3));
int n3 = nam2num["one"] + nam2num["two"];
cout << n3 << " called ";
for (MSI::const_iterator i = nam2num.begin();
    i != nam2num.end(); ++i)
if ((*i).second == n3)
{cout << (*i).first << endl;}</pre>
```

③ □■ 3 called three

2.11 Multimap

#include <multimap.h>

```
\begin{array}{c} \operatorname{template}\langle \operatorname{class} \, \mathbb{K} \mathtt{ey}, \, \operatorname{class} \, \mathbb{T}, \\ \operatorname{class} \, \mathbb{C} \mathtt{ompare} = \operatorname{less}\langle \mathbb{K} \mathtt{ey}\rangle, \\ \operatorname{class} \, \mathbb{A} \operatorname{lloc} = \operatorname{allocator}\rangle \\ \operatorname{class} \, \mathbf{multimap}; \end{array}
```

See also 2.2 and 2.7.

2.11.1 Types

multimap::value_type // pair $\langle \underline{\text{const}} \mathbb{K} \text{ey}, \mathbb{T} \rangle$

2.11.2 Members

multimap::multimap(

const Compare & cmp = Compare();

multimap::multimap(

```
InputIterator first,
InputIterator last,
const Compare& cmp=Compare());
```

3 Container Adaptors

3.1 Stack Adaptor

#include <stack>

Default constructor. Container must have back(), push_back(), pop_back(). So vector, list and deque can be used.

bool stack::empty() const ;

```
Container::size_type stack::\mathbf{size}() \stackrel{\mathsf{const}}{=} ;
```

stack::**push**(<u>senst</u> Container::value_type& x); void stack::**pop**():

const Container::value_type& stack::top() const;

void Container::value_type& stack::top();

Comparision Operators

```
bool operator==(\underbrace{\text{const}}_{\text{stack\& } s0}, \underbrace{\text{stack\& } s1}_{\text{stack\& } s1}); bool operator<(\underbrace{\text{const}}_{\text{const}} stack& s0, \underbrace{\text{const}}_{\text{stack\& } s1});
```

3.2 Queue Adaptor

#include <queue>

```
 \begin{array}{c} | \ \operatorname{template}\langle \operatorname{class} \ \mathbb{T}, \\ \quad \operatorname{class} \ \mathbb{C} \text{ontainer} {=} \operatorname{deque}\langle \mathbb{T}\rangle \ \rangle \\ \operatorname{class} \ \mathbf{queue}; \end{array}
```

Default constructor. Container must have empty(), size(), back(), front(), push_back() and pop_front(). So list and deque can be used.

bool queue:: $\mathbf{empty}() \stackrel{\mathtt{const}}{=} ;$

Container::size_type queue::size() const :

```
void queue::push(\underline{\text{const}} \mathbb{C}ontainer::value_type& x); void queue::pop(); \underline{\text{const}} \mathbb{C}ontainer::value_type& queue::front() \underline{\text{const}}; \mathbb{C}ontainer::value_type& queue::front(); \underline{\text{const}} \mathbb{C}ontainer::value_type& queue::back(); \underline{\text{const}} \mathbb{C}ontainer::value_type& queue::back(); \underline{\text{Container}}; \underline{\text{Container}}; \underline{\text{const}} queue& q0, \underline{\text{const}} queue& q1); bool operator<(\underline{\text{const}} queue& q0, \underline{\text{const}} queue& q1);
```

3.3 Priority Queue

#include <queue>

```
\begin{array}{c} \operatorname{template}\langle \operatorname{class} \mathbb{T}, \\ \operatorname{class} \mathbb{C}\operatorname{ontainer} = \operatorname{vector}\langle \mathbb{T}\rangle, \\ \operatorname{class} \mathbb{C}\operatorname{ompare} = \operatorname{less}\langle \mathbb{T}\rangle \rangle \\ \operatorname{class} \operatorname{\mathbf{priority}} = \operatorname{\mathbf{queue}}; \end{array}
```

Container must provide random access iterator and have empty(), size(), front(), push.back() and pop_back(). So vector and deque can be used.

Mostly implemented as heap.

3.3.1 Constructors

```
 \begin{array}{c} \text{explicit } \textbf{priority\_queue::priority\_queue}(\\ & \underline{\text{coms}} \ \mathbb{C} \\ \text{ompare} \& \ \text{comp} = \mathbb{C} \\ \text{ompare}()); \\ \textbf{priority\_queue::priority\_queue}(\\ & \mathbb{I} \\ \text{nputIterator} \quad \textit{first}, \end{array}
```

bool priority_queue::empty() const;

3.3.2 Members

```
Container::size_type
priority_queue::size() const;
const Container::value_type&
priority_queue::top() const;
Container::value_type& priority_queue::top();
void priority_queue::push(
const Container::value_type& x);
void priority_queue::pop();
No comparision operators.
```

value):

result):

Algorithms

#include <algorithm>

STL algorithms use iterator type parameters. Their names suggest their category (See 6.1).

For abbreviation, the clause —

template (class \mathbb{F} oo, ...) is dropped. The outlined leading character can suggest the template context.

Note: When looking at two sequences: $S_1 = [first_1, last_1)$ and $S_2 = [first_2, ?)$ or $S_2 = [?, last_2)$ — caller is responsible that function will not overflow S_2 .

Query Algorithms

```
Function // f not changing [first, last]
for_each(InputIterator first,
          InputIterator last,
```

Function f); \$₹7.4

InputIterator // first i so i==last or *i==val find(Input Iterator first,

Input Iterator last, const T

val): №7.2 InputIterator // first i so i==last or pred(i)

        struct unarv_function {
           typedef Arg argument_type;
           typedef Result result_type;}
Derived unary objects:
struct negate\langle \mathbb{T} \rangle:
struct logical_not\langle \mathbb{T} \rangle;
  template(class Arg1, class Arg2,
               class Result)
   struct binary_function {
    typedef Arg1 first_argument_type:
    typedef Arg2 second_argument_type;
    typedef Result result_type;}
Following derived template objects accept two
operands. Result obvious by the name.
struct plus\langle \mathbb{T} \rangle;
struct minus\langle \mathbb{T} \rangle;
struct multiplies \langle \mathbb{T} \rangle:
struct divides \langle \mathbb{T} \rangle;
struct \mathbf{modulus}\langle \mathbb{T} \rangle;
struct equal_to\langle \mathbb{T} \rangle:
struct not_equal_to\langle \mathbb{T} \rangle:
struct greater\langle \mathbb{T} \rangle;
struct less(\mathbb{T}):
struct greater_equal\langle \mathbb{T} \rangle;
struct less_equal\langle \mathbb{T} \rangle;
```

comp);

5.1 Function Adaptors

5.1.1 Negators

bool // negate pred

```
template(class Predicate)
class unary_negate: public
unary_function(Predicate::argument_type,
bool);
unary_negate::unary_negate(
Predicate pred);
```

Predicate::argument_type x);
unary_negate(Predicate)

unary_negate::operator()(

not1(const Predicate pred);

```
template (class Predicate)
class binary_negate: public
binary_function(
    Predicate::first_argument_type,
    Predicate::second_argument_type);
bool):
```

binary_negate $\langle \mathbb{P}redicate \rangle$ not2(\underline{const} $\mathbb{P}redicate pred);$

5.1.2 Binders

```
template (class  peration)
class binder1st: public
unary_function(
 peration::second_argument_type,
 peration::result_type);
```

```
template(class Operation)
class binder2nd: public
unary_function(
Operation::first_argument_type,
Operation::result_type);
```

```
binder2nd::binder2nd(

op,

op,

op,

op,

peration::second_argument_type y);

// argument_type from unary_function

Operation::result_type

binder2nd::operator()(

const binder2nd::argument_type x);

binder2nd(Operation)

bind2nd(const Operation& op, const T& x);

To 7.7.
```

5.1.3 Pointers to Functions

```
template(class Arg, class Result)
class pointer_to_unary_function:
public unary_function(Arg, Result);
```

pointer_to_unary_function $\langle A rg, Result \rangle$ $ptr_fun(Result(*x)(Arg));$

```
\begin{array}{c} \operatorname{template} < \operatorname{class} \ \mathbb{A} \operatorname{rg1}, \ \operatorname{class} \ \mathbb{A} \operatorname{rg2}, \\ \operatorname{class} \ \mathbb{R} \operatorname{esult} > \\ \operatorname{class} \ \operatorname{\mathbf{pointer\_to\_binary\_function}} : \\ \operatorname{public} \ \operatorname{binary\_function} \langle \mathbb{A} \operatorname{rg1}, \ \mathbb{A} \operatorname{rg2}, \\ \mathbb{R} \operatorname{esult} \rangle; \end{array}
```

 $\begin{array}{c} \text{pointer_to_binary_function}(\mathbb{A} \text{ rg1}, \mathbb{A} \text{ rg2}, \\ \mathbb{R} \text{esult} \rangle \\ \textbf{ptr_fun}(\mathbb{R} \text{esult}(*x)(\mathbb{A} \text{ rg1}, \mathbb{A} \text{ rg2})); \end{array}$

6 Iterators

#include <iterator>

6.1 Iterators Categories

Here, we will use:

- X iterator type.
- a. b iterator values.
- r iterator reference (X& r).
- t a value type T.

Imposed by empty struct tags.

6.1.1 Input, Output, Forward

struct input_iterator_tag {} F 7.8 struct output_iterator_tag {} struct forward_iterator_tag {}

In table follows requirements check list for Input, Output and Forward iterators.

Expression; Requirements			О	F
X() X u	might be singular			•
X(a)	$\Rightarrow X(a) == a$ $*a=t \Leftrightarrow *X(a)=t$	•		•
X u(a) X u=a	⇒ u == a	•		•
	u copy of a	Г	•	
a==b	equivalence relation	•		•
a!=b	⇔!(a==b)	•		•
r = a	⇒ r == a	Г		•
*a	convertible to T. a==b ⇔ *a==*b	•		•
*a=t	(for forward, if X mutable)	Г	•	•
++r	result is dereferenceable or past-the-end. &r == &++r	•	•	•
	convertible to const X&	•	•	
	convertible to X& r==s \In ++r==++s			•
r++	convertible to X& ⇔{X x=r;++r;return x;}	•	•	•
*++r *r++	convertible to T	•	•	•

rs 7.7.

6.1.2 Bidirectional Iterators

struct bidirectional_iterator_tag {} The forward requirements and:

```
--r Convertible to const X&. If ∃ r=++s then

--r refers same as s. &r==&--r.

--(++r)==r. (--r == --s ⇒ r==s.

r-- ⇔ {X x=r; --r; return x;}.
```

6.1.3 Random Access Iterator

struct random_access_iterator_tag {}

The **bidirectional** requirements and (m,n iterator's *distance* (integral) value):

 $r+=n \Leftrightarrow \{for (m=n: m-->0: ++r):$

```
for (m=n; m++<0; --r);

return r;} //but time = O(1).

a+n ⇔ n+a ⇔ {X x=a; return a+=n]}

r-=n ⇔ r += -n.

a-n ⇔ a+(-n).

b-a Returns iterator's distance value n, such

that a+n == b.
```

a
b Convertible to bool, < total ordering.

a
c Convertible to bool, > opposite to <.

 $a \le b \Leftrightarrow !(a > b).$ $a \ge b \Leftrightarrow !(a \le b).$

 $a[n] \Leftrightarrow *(a+n).$

6.2 Stream Iterators

```
template (class \mathbb{T}.
          class Distance=ptrdiff_t)
 class\ istream\_iterator:
      public iterator (input_iterator_tag, T, Distance);
// end of stream №7.4
istream_iterator::istream_iterator();
istream_iterator::istream_iterator(
    istream & s); \square 7.4
istream_iterator::istream_iterator(
    \underline{\text{const}} istream_iterator(\mathbb{T}, \mathbb{D} istance)&);
istream_iterator:: istream_iterator():
const T& istream_iterator::operator*() const:
bool // all end-of-streams are equal
operator==(const istream_iterator,
              const istream_iterator);
```

```
template(class T)
class ostream_iterator:
    public iterator(output_iterator_tag, void, ...);
// If delim \neq 0 add after each write
```

```
ostream& s,
const char* delim=0);

ostream_iterator::ostream_iterator(
const ostream_iterator s);

ostream_iterator& // Assign & write (*o=t)
ostream_iterator::operator*() const ;

ostream_iterator&
ostream_iterator*:operator=(
const ostream_iterator s);

ostream_iterator& // No-op
ostream_iterator*::operator++();

ostream_iterator& // No-op
ostream_iterator*::operator++(int);
```

ostream_iterator::ostream_iterator(

6.3 Typedefs & Adaptors

```
template(\mathbb{C}ategory, \mathbb{T},
         Distance=ptrdiff_t.
         Pointer=T*, Reference= T&>

operator -(\frac{\text{const}}{\text{self} \& r0}, \frac{\text{const}}{\text{self} \& r1});
self // n + r.base()
operator-(\mathbb{D} istance n, \stackrel{\text{const}}{=} self& r):
bool // r0.base() < r1.base()
operator<(\underline{\text{const}} \text{ self } \& r0, \underline{\text{const}} \text{ self } \& r1);
```

```
6.3.3 Insert Iterators
```

```
template(class Container)
class back_insert_iterator:
     public output_iterator:
```

```
template(class Container)
class front_insert_iterator :
     public output_iterator:
```

```
template(class Container)
class insert_iterator:
     public output_iterator;
```

Here \mathbb{T} will denote the Container::value_type. Constructors

```
\begin{array}{l} \text{explicit} \quad /\!/ \; \exists \; \mathbb{C}\text{ontainer}.:push\_back(\underbrace{const} \; \mathbb{T}\&) \\ \text{back\_insert\_iterator}::back\_insert\_iterator( \end{array}
                 Container (x):
```

explicit // \exists Container::push_front(\underbrace{const} $\mathbb{T}\&$) front_insert_iterator::front_insert_iterator(Container (x):

```
insert_iterator::insert_iterator(
     \mathbb{C}ontainer
     Container::iterator i);
```

 $// \exists \mathbb{C}$ ontainer:: $insert(\underbrace{const} \mathbb{T} \&)$

Denote Inslter = back_insert_iterator $insFunc = push_back$ iterMaker = back_inserter \bigsim 7.4

 $Inslter = front_insert_iterator$ $insFunc = push_front$ iterMaker = front_inserter

Inster = insert iterator insFunc = insert

Member Functions & Operators

```
Inslter& // calls x.insFunc(val)
Inslter::operator=(\underbrace{\text{const}} \mathbb{T}\& val);
Inslter& // return *this
Inslter::operator*();
Inslter& // no-op, just return *this
Inslter::operator++();
Inslter& // no-op, just return *this
Inslter::operator++(int);
```

Template Function

```
Insiter // return Insiter(\mathbb{C}ontainer)(x)
iterMaker(Container \& x);
 // return insert_iterator(\mathbb{C}ontainer)(x, i)
insert_iterator(Container)
inserter(\mathbb{C}ontainer \& x, \mathbb{I}terator i);
```

7 Examples

```
7.1 Vector
// safe get
int vi(const vector<unsigned>& v. int i)
{ return(i < (int)v.size() ? (int)v[i] : -1);}
// safe set
void vin(vector<int>& v, unsigned i, int n) {
   int nAdd = i - v.size() + 1:
   if (nAdd>0) v.insert(v.end(), nAdd, n):
   else v[i] = n:
7.2 List Splice
